Report on Vital Statistics for the year 1994

This Report has been prepared by the Central Statistics Office for the Minister for Health and Children in accordance with the provisions of Section 2 of the Vital Statistics and Births, Deaths and Marriages Registration Act, 1952. Births are classified according to the area of residence of the mother and deaths according to the area of residence of the deceased.

Births and deaths for each year since 1943 exclude late registrations; while deaths for each of the years 1940 to 1967 exclude non-residents. From 1968 however, the number of deaths includes non-residents.

The main statistics contained in this Report have already been published, classified by year of registration, in the CSO Quarterly Vital Statistics reports. This annual report gives a further breakdown in respect of births and deaths which occurred in 1994. The year of occurrence data have been compiled from registration data for 1994 and 1995. The report also gives further information on marriages registered in 1994.

More up to date information on Vital Statistics is published in the Quarterly Report on Births, Deaths and Marriages published about five months after the end of the quarter to which the data relate. In the Quarterly Report, births and deaths are classified according to quarter of registration.

General Summary

Marriages: There were 16,621 marriages registered during the year 1994 compared with 16,824 in 1993. The marriage rate per 1,000 population was 4.6 compared with 4.7 in 1993.

Births: The number of births which occurred during 1994 was 48,255: 24,957 males and 23,298 females. The birth rate was 13.5 per 1,000 population compared with 13.8 in 1993. The number of births outside marriage which occurred in 1994 was 10,049 or 21% of all births.

Deaths: The number of deaths occurring during 1994 was 30,948: 16,338 males and 14,610 females. The death rate was 8.6 per 1,000 population. In 1993 deaths numbered 32,148 and the rate was 9.0.

Of the deaths occurring in 1994, 32% were due to ischaemic and other forms of heart disease; 23.9% to cancer; 13.2% to other diseases of the circulatory system and 14% to diseases of the respiratory system.

There were 7,412 deaths from malignant neoplasms and neoplasms of lymphatic and haematopoietic tissues. Of these, 27 were caused by Hodgkin's disease and 194 by leukaemia and aleukaemia. The death rate for cancer (ICD-9 nos. 140-208) in 1994 was 2.07 per 1,000 population, 0.05 less than in 1993.

During 1994 the number of deaths of infants under one year was 277 compared with 302 in 1993. The corresponding rate fell from 6.1 to 5.7 per 1,000 live births.

The total number of deaths from accidents and other external causes in 1994 was 1,447 of which motor vehicle accidents accounted for 399 deaths. The corresponding figures for 1993 were 1,377 and 411 respectively.

Population: The estimated population in April 1994 was 3,585,900: 1,783,300 males and 1,802,600 females.

Issue of Authority for Registration: Births and deaths (where no inquest has been held) which have not been registered within one year of their occurrence can be registered only on the authority of An tArd Chlaraitheoir (Registrar General). The tables in the main body of this Report exclude such births and deaths. The Appendix to the Report contains an analysis of late death registrations in 1994 and of some deaths where an inquest has been held. The number of such deaths registered in 1994 was 372.

MARRIAGES

The number of marriages registered in 1994 was 16,621 a decrease of 203 on the previous year; the rate was 4.6 per 1,000 population, 0.1 below that for 1993. Tables 4 and 5 of this report show the average numbers of marriages registered and marriage rates for 10 year periods since 1864 and for each year since 1985. The following table compares the marriage rate in Ireland in the years 1941 to 1994 with those in Northern Ireland, England and Wales and Scotland.

Age at Marriage

The statistics recorded on registration of marriage include the ages of the bride and groom. This information has been collected on an ongoing basis since 1957. Similar details were recorded in the 1946 Census of Population in respect of persons married in 1945/46. The following table summarises the main trends in age at marriage.

Table II Percentage distribution of marriages according to age of groom and age of bride and average age at marriage in 1945–1946 and in each year 1991–1994

In 1994, the proportion of grooms and brides at ages under 25 years continued to fall while the proportion aged 25 to 34 grew. The average age at marriage has been increasing since 1984; the average age for males being 29.8 years and for females, 27.8 years in 1994. In Table 46 all marriages registered in 1994 are cross-classified by age of groom and age of bride in single years. Table 47 gives similar details for first marriages. The average ages at first marriage of males and females were 29.4 and 27.5 respectively in 1994.

Table III compares first marriage rates per 1,000 single population in each age group in Ireland and in England and Wales in 1994. The figures were obtained by dividing the number of single males marrying in each group by the total number of single males in that age group and similarly for females.

² 16-19 years for England and Wales

For each sex the marriage rates in Ireland were considerable below those in England and Wales in the two youngest age groups. In the 25-44 year age groups the rates for both males and females in Ireland were higher than the rates in England and Wales in 1994. In the age groups 45 years and over the rates for England and Wales were higher than the Irish rates.

Mode of Celebration

A total of 15,200 marriages (i.e. 91.5% of all marriages) were celebrated in accordance with the rites and ceremonies of the Catholic Church in 1994. There were 1,421 marriages according to other rites and ceremonies; 434 Church of Ireland, 51 Presbyterian, 33 Methodist, 3 Jewish, 50 other religious denominations and 850 civil marriages in a Registrar's Office.

The rate for Catholic Marriages in 1994 was 4.5 per 1,000 of the Catholic population. The rate for all other marriages was 6.6 per 1,000 of the population other than Catholic.

¹ Average annual number of marriages and rates for decennial periods 1951–1990

Marriages are classified according to form of ceremony, age of groom and age of bride in Tables 48 and 49. For Catholic marriages the average age of the groom was 29.5 years compared with 32.1 years for other marriages (including Civil marriages). The average age of the bride for Catholic marriages was 27.7 years and for other marriages, 29.3 years.

Socio-Economic Group (SEG)

This classification is widely used in Census of Population statistics and is determined by a person's occupation or, in some cases, by a combination of occupation and employment status. The socio-economic group (SEG) of a person not gainfully occupied is considered to be that of the gainfully occupied person on whom he or she is deemed to be dependent. The men and women married in 1994 were classified by SEG on the basis of the information on occupation given in the marriage register. The results obtained are given in Tables 50 to 52.

In Tables 50 and 51 grooms and brides are classified by SEG and age at marriage. For both grooms and brides the average marriage age in 1994 was higher in the SEG "Farmers, farmers' relatives assisting and farm managers" than in any other group and the lowest average age was in the "Other manual workers" group.

Table 52 shows marriages registered in 1994 classified by the SEG of groom and bride. The highest number of marriages among males occurred in the "Skilled manual workers" group which accounted for 28 % of the grooms excluding the "not stated" cases. The highest among females was in the "Intermediate non-manual workers" group which accounted for 33% of the brides. The table also gives information on the respective SEGs of grooms and brides. Over half of the women in the SEGs "Farmers, farmers' relatives assisting and farm managers" and "Manual Workers" married men in the same groups. The majority of women in the "Intermediate and other non-manual workers" group married men in another SEG.

Area of residence

Four classifications of district are available: that in which the marriage took place, the areas of residence of the bride and groom prior to marriage, and the intended future residence. In Table 45, figures for marriages according to where the marriage took place are given for 1994.

A comparison between the area of residence of the bride before the ceremony and the area in which the marriage took place is made in Table V. In Tables 53 and 54 marriages are classified by area of residence prior to marriage and by age group of groom and bride. Looking solely at marriages for which the area of residence was within the State, the average age at marriage for grooms was lowest in Waterford County Borough, (28.2) and highest in Leitrim, (31.0). The average age for brides was lowest in Kildare and Laois, (26.7) and highest in Dun Laoghaire Rathdown, (29.1).

In Table 55 marriages are cross-classified by area of residence before marriage of groom and bride. As is to be expected, in the great majority of cases the groom and bride were from the same or neighbouring counties. A feature of the table is the large number of cases in which the address of one or both of them was outside the State. Of the men married in the State in 1994, 1,471 were returned as residing in England, Wales or Scotland, 242 in Northern Ireland and 692 in other countries. The number of brides who were resident before marriage in England, Wales or Scotland was 1,222, the number from Northern Ireland was 129 and the number from other countries was 564. In 1,808 cases both the groom and bride were living outside the State.

Table VI compares marriage rates based on County of Registration (the simplest way of calculating marriage rates) with an alternative obtained by relating marriages classified by area of residence of groom before marriage to total resident population. Rates (a) and (b) differ as marriages of men whose area of residence was outside the country were included in the calculation of rate (a) and excluded from rate (b). Rate (b) includes marriages of men from the county who married outside the county.

Since 1990, about one sixth of marriages each year have had intended future residence outside the State (see Table VII). In the case of 1,477 marriages the future residence was in England and Wales, 235 in Northern Ireland, 60 in Scotland, 166 in other parts of Europe, 509 in the United States of America, 36 in Canada, 108 in Australia and New Zealand and 70 elsewhere.

The age distributions and average ages of the grooms and brides going to the various countries are shown in Tables 56 and 57 respectively. The marriages of persons going abroad are classified by socio-economic groups of groom and bride in Tables 58 and 59 respectively. By comparing Tables 50 and 58 it is possible to examine the proportions of men marrying in each socio-economic group who intended to reside outside the country; this proportion varied considerably between the different groups, as can be seen in Table VIII.

A classification of marriages of persons going abroad by form of marriage ceremony is made in Table 60. In the case of Catholic marriages the percentage with intended future residence outside the State was 16%, the same as 1993. The corresponding figure for all other marriages was 17% in 1993 and 18% in 1994.

Finally, in Tables 61 and 62, the marriages of persons going abroad are classified by area of residence before marriage of the groom and bride respectively. The proportions which these marriages represent of the total when classified according to area of residence of groom are shown in Table IX.

Births

The number of births which occurred in 1994 was 48,255 comprising 24,957 males and 23,298 females. The corresponding total for 1993 was 49,304, 25,359 males and 23,945 females. The birth rate in 1994 was 13.5 per 1,000 population, compared with 13.8 in 1993.

Classification by age at maternity, parity and duration of marriage

Table 42 shows the total number of births which occurred in 1994 classified by age of mother at maternity and number of previous liveborn children (i.e. parity). The mother's age was not stated in respect of 356 births (or 0.7% of the total). In 1993 the corresponding number was 371 (0.8%). The results contained in Table 42 are summarised in Table XI. In preparing this table the procedure in the case of multiple births was to count each child as an individual birth. For instance if a fifth pregnancy produced twins, the children would be classified as a fifth and sixth child in parity order.

Between the mid 1960's and the mid 1970's the percentage of mothers in the younger age groups increased, so that by 1975 mothers under 30 years accounted for 61.7% of births. Subsequently the proportion declined fairly steadily to reach 49.9% in 1993 and 48.8% in 1994. In England and Wales and in Scotland in 1994, 61.9% and 62.9% respectively of young mothers were aged under 30.

The difference between this country and England and Wales and Scotland shown in Table XII is due to the fact that women in Ireland marry at a later age and have on average more children, as may be seen from Table XV. Table XIII shows the percentage distribution of first births within marriage by age of mother.

¹ First Births of First Marriage in Scotland

Table XIV compares fertility rates in Ireland and England and Wales in 1994. In most age groups the number of births within marriage per 1,000 married women was considerably higher in Ireland than in England and Wales. The number of births outside marriage per 1,000 single, widowed, divorced and separated women was lower in Ireland than in England and Wales with the exception of the 45–49 age group which was the same.

The total number of births outside marriage was 10,049 in 1994, i.e. 223 more than in 1993. This was equivalent to an annual rate of 22.2 per 1,000 unmarried females aged 15–49 years and was 20.8% of all births. The number of births outside marriage has shown an increase every year since 1959 when the lowest ever number was recorded.

¹ Since the number of births within marriage in the under 20 age group is small, caution should be exercised in the interpretation of trends in this rate.

The percentage distribution of births within marriage according to the number of previous children in 1993 and 1994 is shown in Table XV and a comparison made with the corresponding distributions in England and Wales and Scotland in 1994.

The difference between the years 1993 and 1994 in respect of the percentage distribution according to number of previous children was slight. The percentage of mothers with two or more previous children was higher in Ireland than in either England and Wales or Scotland. In Ireland in 1994, 3.9% of mothers had 5 or more previous children compared to 1.3% in England and Wales and 0.8% in Scotland.

Multiple Births

The number of maternities in 1994 which resulted in multiple live births was 594 consisting of 579 sets of twins, 14 sets of triplets and one set of quads. This is equivalent to a “twinning rate” of 12.2 (i.e. the number of live twins per 1,000 maternities which resulted in live births). Table XVI summarises the number of multiple births and the “twinning rate” for the years 1980 to 1994

Deaths

The number of deaths which occurred during the year 1994 was 30,948 of which 16,338 were males and 14,610 were females. This is equivalent to a rate of 8.6 deaths per 1,000 total population compared to 9.0 in 1993 and 8.7 in 1992.

Table 9 shows the annual average death rates, by age group, for decennial periods from 1864 to 1990 and the death rates for each year 1985 to 1994.

While the crude death rate per 1,000 population has shown a gradual downward trend since the beginning of the century, striking falls occurred in the death rates at the younger ages.

Table XVII compares the death rates in the years 1941-1994 with those in Northern Ireland, England and Wales and Scotland. The death rate in this country in 1994 was lower than in Northern Ireland, England and Wales and Scotland. Over the period covered in the table the decrease in this country has been greater than that in any of the other areas.

These comparisons are based on crude death rates, which are to some extent affected by differences in the age-sex structures of the population in the different countries, while comparisons over a period of years are also affected by changes in the age-sex structures of the population.

Comparison between counties

Variations in the age distribution of the population from one county to another have an effect on the comparability of death rates between counties. If a particular county contains a large proportion of elderly persons the crude death rate per 1,000 population will be relatively high even if the health conditions in that county are better than the general average. To overcome this, standardised rates are prepared. For a particular county this is done by calculating the death rate in each age group of the population in that county and then multiplying the death rate in each age group by the population in the whole country in that age group and summing the resulting products. This sum is then divided by the total population in the country at all ages to give the standardised rate for the county. See Table XVIII.

In certain areas the standardised death rates differ appreciably from the crude rates, the extremes being Dublin Belgard which had a crude death rate of 4 and a standardised rate of 8.86 (reflecting the very young age structure in Dublin Belgard) and Leitrim where standardisation had the effect of lowering the death rate from 13.41 to 8.68 because of the comparatively old age structure in that county. The standardised rates in 1994 were lowest in Galway County Borough, 6.69 and highest in Limerick County Borough, 9.93.

Causes of Death

The Ninth Revision of the International Classification of Diseases, Injuries and Causes of Death (ICD-9), as recommended by the World Health Organisation, has been used to classify deaths in Ireland by cause since 1979. It replaced the Eighth Revision (ICD-8) which was used from 1968 to 1978. To facilitate linkage with previous years all deaths in 1979 were, in addition, coded according to ICD-8. A cross-classification of deaths occurring in 1979 by the ICD-8 and ICD-9 classifications is contained in Tables 60-63 of the 1979 Report. As ICD-9 imposed certain changes in interpretation of recorded medical opinion regarding the underlying cause of death when more than one disease is mentioned on the medical certificate of cause of death, care should be taken in comparing deaths coded according to ICD-9 with those prior to 1979.

Injury and Poisoning:- This category forms part of the main body of classification in ICD-9 and deaths coded accordingly are shown in Table 19.

External Causes of Death:- In the Sixth, Seventh and Eighth Revisions the E-code was considered as part of the main classification. In ICD-9 the E-code is treated as a supplementary classification to be used where relevant in conjunction with codes from any part of the main classification.

Table XIX shows that heart diseases remained the single biggest cause of death. Since 1970 - 72 there has been a 6% drop in the number of deaths from heart disease and a 31% rise in the number of deaths from cancer. Deaths from influenza in the early 1990's were significantly below the level twenty years earlier.

Of the deaths occurring in 1994, 79% were due to the four main causes, i.e. Ischaemic and other forms of heart disease, malignant neoplasms, cerebrovascular disease and respiratory diseases. Most of these deaths occurred at ages over 65. Diseases of the heart were responsible for the highest rates, 310 per 100,000 population for males and 243 per 100,000 females. Malignant neoplasms were the next major cause, the rates for which were 223 and 191 for males and females respectively per 100,000 population. The rates for cerebrovascular disease were 67 and 94 respectively for males and females per 100,000 population. The deaths from respiratory diseases were due mainly to pneumonia and bronchitis. Table XX contains more information on deaths classified by causes and age groups.

Some of the principal causes of deaths are considered in greater detail in the following sections.

Tuberculosis

In 1994 there were 52 deaths from tuberculosis, of which 34 were caused by the respiratory form and 18 by other forms of the disease. Deaths from the tuberculosis are now only at a fraction of their level 50 years ago. All of the 52 deaths in 1994 were in the age group 45 and over.

The mortality from tuberculosis in the counties and county boroughs in 1994 is compared in Table 12 of this Report.

In the years under review the death rates from cancer showed little difference between males and females in the age groups under 34 years but between the ages 35 and 54 years the female rates were generally greater than those for males. In 1994 the male death rate for all ages was 16.8% above that for females.

Comparability with data compiled pre-1950:

Prior to 1950 under the Fifth Revision of the International List of Causes of Death, cancer deaths were those classified under codes 045 – 055. With the introduction of the Sixth Revision in 1950 the World Health Organisation recommended that total cancer deaths should be based upon Nos. 140 – 205 (Nos. 140 – 208 in the Ninth Revision) of the International Statistical classification which now includes Hodgkin's disease and leukaemia. Thus, for comparability with the years prior to 1950 the total cancer figure less Hodgkin's disease and leukaemia should also be shown. In 1994 there were 7,412 deaths from cancer (Nos. 140 to 208). Of this number 27 deaths were caused by Hodgkin's disease and 194 by leukaemia and aleukaemia.

*Exclusive of Northern Ireland

In the period under review the crude rates for England and Wales and Scotland were consistently higher than those for this country and Northern Ireland.

The death rates from cancer in 1994 in counties and county boroughs are compared in Table XXIV. Standardised rates, which eliminate the effect of different age distributions in the different areas, are also shown. The crude death rate from cancer in 1994 varied from 2.69 per 1,000 population in Dublin County Borough to 1.10 in Dublin Belgard. When comparing the relative seriousness of mortality in different counties it is, of course, the standardised rates which should be used. In the counties of the west and north-west, standardisation had the effect of lowering the death rates considerably. The standardised rates varied from 2.65 per 1,000 population in Cork County Borough to 1.49 in Waterford County Borough.

Full details of deaths due to cancer occurring in 1994, classified by site of the disease and age group are contained in Table 19. The number of deaths and death rates from cancer per 100,000 in each group for the main groups of sites are shown in Table XXV, which shows that there is, in general, a rapid rise in the death rate with increasing age. Deaths due to malignant neoplasms of the digestive system represented nearly one third of the total cancer deaths for both males and females, the death rate for males being 26% higher than that for females. The death rate from malignant neoplasms of the respiratory system for males was more than double that for females.

About twice as many men as women die from cancer of the bronchus, trachea and lung. While death rates from these cancers have generally fallen in the under-65 age groups for both men and women since 1980, the death rates for males and females over 65 have fluctuated in recent years but have decreased again in 1994. While the overall mortality trend for males has remained relatively stable, it is increasing for females for this particular cause of death.

The following table shows deaths and death rates from cancer of the bronchus, trachea and lung in Ireland and neighbouring countries during the years 1980 to 1994.

Diseases of the circulatory system

There were 14,018 deaths ascribed to diseases of the circulatory system (Nos. 390–459) in 1994, of which 7,304 were deaths of males and 6,714 of females. Details of these deaths, classified by cause and age may be obtained from Table 19 of this report while the numbers assigned to each county and county borough are shown in Table 20. Deaths and death rates from certain groups of causes are given in Table XXVIII.

The excess of male over female deaths is largely reflected in the number of deaths from ischaemic heart disease (4,569 males compared with 3,240 females), the majority of which were due to acute myocardial infarction (3,290 males compared with 2,296 females). The converse is true for cerebrovascular disease (1,693 females compared with 1,193 males). In respect of the remaining groups of causes the difference between the male and female death rates is not nearly so pronounced.

Respiratory Diseases

Deaths from respiratory diseases (Nos. 460–519 in the International List) in 1994 numbered 4,333. These included 1,984 deaths from pneumonia, 225 from bronchitis, 11 from influenza and 2,113 due to other respiratory diseases.

Pregnancy, childbirth and puerperium

There was one maternal death in 1994 compared with none in 1993.

Table XXX shows the maternal mortality rates in Ireland and the neighbouring countries for the years 1980 – 1994.

Infant and Late Foetal Mortality

The terms used in relation to infant and late foetal mortality are defined as follows:

Infant death: Death at ages under 1 year of live born infant.

Early neo-natal death: Death at ages under 1 week of live born infant.

Neo-natal death: Death at ages under 4 weeks of live born infant.

Post-neo-natal death: Death between the ages of 4 weeks and 1 year of live born infant.

Late foetal death (stillbirth): Foetal death at or over 28 weeks gestation.

Perinatal deaths: Late foetal plus early neo-natal deaths.

Infant mortality rate: Infant deaths divided by total live births, multiplied by 1,000.

Neo-natal mortality rate: Neo-natal deaths divided by total live births, multiplied by 1,000.

Early neo-natal mortality rate: Early neo-natal deaths divided by total live births, multiplied by 1,000.

Late foetal mortality rate: Late foetal deaths divided by total live births plus late foetal deaths, multiplied by 1,000.

Perinatal mortality rate: Perinatal deaths divided by total live births plus late foetal deaths, multiplied by 1,000.

While statistics of infant mortality are obtained in the course of the usual procedure for registration of deaths, which has been in operation since the year 1863, particulars of late foetal mortality have been obtained through a scheme of notification to the Directors of Community Care. The scheme of notifying late foetal deaths was introduced in 1957, but comparisons between different areas of the country showed marked differences in the coverage of the scheme in the early years. Consequently, the number of late foetal deaths in the early years of the scheme is believed to be understated.

It will be seen from Table XXXI that the highest individual rate for infant mortality was in Cork County Borough and the lowest in Meath. The rate for perinatal mortality was highest in Roscommon and lowest in Tipperary N.R. while for late foetal mortality the highest rate was in Longford and lowest in Kilkenny.

The infant and late foetal mortality rates in some areas based on small numbers are subject to considerable fluctuation and caution should be exercised in their interpretation.

Infant mortality

During the year 1994 there were 277 deaths of infants under one year, compared to 302 in 1993. The infant mortality rate, which continued to decline over the years to 8.8 in 1985, has fluctuated slightly since then, the rate declining to 5.7 in 1994.

The causes of deaths of infants under one year, classified according to the Detailed International List, are shown in Table 19. In Table 25 infant deaths are again classified by cause and a more detailed age classification shown. These results are summarised in Table XXXIV.

The relative importance of the various groups of causes differs appreciably between deaths of infants aged under one week and deaths at ages 4 weeks to 1 year. Of all deaths at ages under one week, 44% were due to congenital anomalies; 11% to immaturity and birth injuries and 5% to anoxic and hypoxic conditions not elsewhere classified.

On the other hand, the most common cause of death for infants aged 4 weeks to 1 year was sudden death (39%) followed by congenital anomalies (35%).

* For definition see page 37

Deaths classified as being due to ill-defined conditions originating in the perinatal period accounted for 36% of the total late foetal deaths. Deaths classified as being due to placental and cord injuries to fetus accounted for 33% of late foetal deaths. Deaths due to intrauterine hypoxia and birth asphyxia were next at 14% and deaths due to congenital anomalies at 13%.

As can be seen from Table XXXVI 292 late foetal deaths in 1994 occurred in hospitals; this is equivalent to 98% of the total number of late foetal deaths.

Accidents, poisoning and violence

The number of deaths from external causes (numbers E800–E999) occurring in 1994 was 1,447 of which 1,019 were males and 428 were females. The corresponding figures for 1993 were 1,377 deaths – 937 male and 440 female. As has been mentioned on page 9 deaths which have not been registered within one year of their occurrence have been excluded from the main body of this report. The exclusion of these cases may have a relatively more significant effect on the number of deaths classified to some external causes.

As can be seen from Table XXXIX there is an excess of male mortality from accidents which may be largely attributed to the category suicide and self-inflicted injury followed by road vehicle accidents. At ages over 75 years, the excess of female deaths may be attributed to accidental falls.

As can be seen from Table XXXX below, 283 deaths resulted from accidents in the home. This compares with 282 in 1993. Of the 283 deaths in 1994, 105 were accidental falls, and two-thirds of these were in the 75 years and over age category. Accidents caused by fire and flames accounted for 72 deaths, 5 of which were in the under 5 age group. There were 35 deaths from accidental poisoning.

Uncertified deaths

The number of cases in 1994 in which the cause of death was not certified by a medical practitioner was 23 which represents 0.07% of the total deaths. This is much lower than the 8.5% in the period 1951-1960 and the 3.1% in the period 1961-70.

Inquests and post-mortems

The number of deaths registered on certificates issued by coroners as the result of inquest and post-mortem examinations during 1994 was 3,410 compared with 3,296 in 1993.
